

Assume that you run a restaurant that sells items in the categories Food, Drinks, and Ice Creams.

1. Let's create a new application based on the Dialog without Buttons template and drag and drop a Tab widget onto the form
2. You will use the Tab widget to display a list of items sold under the three categories.
3. Using the **currentTabTextproperty** of the Tab widget, change the text displayed on each Tab button.
4. Set the text of two buttons to Food And Drinks
5. To add a new Tab button, right-click on either Tab button and select Insert Page from the context menu that appears. You will see two suboptions, After Current Page and Before Current Page
6. Select After Current Page to add a new tab after the Drinks tab. The new tab will have the default text Page, which you will change to Ice Creams using the currentTabTextproperty.
7. Drop CheckBox widgets onto the first Tab button, Food, to display the items available in the Food Category. Similarly, place some widgets on the other two Tab buttons
8. To enhance the appearance of the widgets on the form, you can apply fonts, change their background and foreground colors, and so on USING STYLE SHEET EDITOR
